Summary

Memorandum on Citation Latch faithfulness check.

Briefs were shipping sentences that no source page contained.

Citation Latch drops any sentence whose content words are not mostly present in the cited page.

On the June audit, the checker cut unsupported sentences from 18 percent to 4 percent.

Operator decision: Run the overlap check before every brief is shown, and surface rejected lines to the analyst..

Evidence

Method note: Two annotators marked unsupported sentences in 50 briefs, and the checker was scored against their union.

Reported result: Precision of the rejection decision was 0.91 and recall of unsupported lines was 0.78.

Limits of the evidence: The overlap rule misses contradictions that reuse the source vocabulary with a flipped conclusion.

Open questions: Can a small entailment model catch reversals without adding more than 200 ms per brief? Risk review: Severity low: A strict overlap threshold will delete valid paraphrases that analysts would have accepted.

Recommended action: Keep rejected sentences in an audit tray rather than discarding them silently..
