Advisory

Advisory: Scanfold table recovery.

Scanned quarterly packets hid the figures analysts needed inside ruled grids.

Findings: Scanfold recovers ruled grids by trusting vector lines when they exist and falling back to text alignment when they do not.

On born-digital pages, cell accuracy reached 96 percent, but on phone photos it fell to 71 percent.

Recommended posture: Use automatic table text for digital PDFs and require analyst confirmation for photo pages..

Assessment

Assessment method: Cell accuracy was scored against 40 hand-transcribed tables, split evenly between digital PDFs and phone photos.

Observed outcome: Digital cell accuracy was 0.96 and photo cell accuracy was 0.71, with header merges causing most photo errors.

Boundaries: Merged header cells were frequently split into extra columns on the phone-photo subset.

Unresolved items: Would a lightweight detector trained on ruling lines close the gap between digital pages and phone photos? Exposure: Severity high: A misread total in a scanned budget table can flow into a decision brief without an obvious visual cue.

Recommended action: Mark machine-read tables as unverified until an analyst confirms the header row..

Transcribed grid

Subset	Cell accuracy
Digital PDF	0.96
Phone photo	0.71
