Minutes

Minutes for Pairwise Ledger comparison protocol.

Side-by-side questions were collapsing into a single blended summary.

The group recorded these points.

Pairwise Ledger requires every comparison aspect to cite each document separately.

Blended summaries were rejected when a result from one paper was attributed to both.

Decision recorded: Require separate citations for each document on methodology and on reported results..

Recorded detail

Evaluation setup discussed: Reviewers scored 20 pair answers for crossed attribution before and after the separate-citation rule.

Figures entered in the minutes: Crossed attributions fell from 9 answers to 1 answer out of 20.

Caveats entered: The protocol was tried on pairs, not on sets of four or more documents.

Questions parked: How should an aspect be shown when only one of the two documents reports it?
Risks assigned: Severity medium: A shared aspect name can imply the two studies measured the same quantity when they did not.

Recommended action: Quote each study's own result sentence under the aspect instead of rewriting a joint figure..
