Minutes

Minutes for Schema Kiln output contract.

Downstream tools were breaking when brief keys changed without notice.

The group recorded these points.

Schema Kiln freezes the brief keys for a release and rejects model output that omits a required key.

After the freeze, parsing failures in the desk tool fell from 9 percent to under 1 percent.

Decision recorded: Validate the frozen keys before display, and reject empty claim lists when sources were provided..

Recorded detail

Evaluation setup discussed: Client logs were compared for the two weeks before and after the key check was deployed.

Figures entered in the minutes: Parse errors dropped from 9.1 percent of briefs to 0.7 percent of briefs.

Caveats entered: The contract check does not judge whether the values are faithful, only whether the keys exist.

Questions parked: How should optional fields be versioned without forcing every client to update on the same day? Risks assigned: Severity low: A model can satisfy the key check with empty lists and still look structurally valid.

Recommended action: Fail a brief that has no claims when the sources are non-empty..
