Observations

Lab note for Heading Probe versus hand rules.

Section titles were being guessed from capitalization alone.

The observations follow.

Heading Probe labels a line as a heading only when it is short, has no trailing period, and is followed by a longer paragraph.

The combined rule raised heading precision from 0.70 to 0.88 on the internal report set.

The working decision is: Use the combined heading rule, and fall back to whole pages when heading candidates are scarce..

Measurement

How it was measured: Precision and recall were computed against 25 reports whose headings had been marked by an editor.

What came back: Heading precision moved from 0.70 to 0.88 and recall stayed near 0.81.

What this does not show: All-capital legal clauses were still marked as headings even when they were body text.

Still unresolved: Can a trained sequence tagger separate legal clauses from titles without a full layout model? Operational risks: Severity medium: A false heading splits a chunk in the middle of an argument and weakens retrieval.

Recommended action: Fall back to page-level chunks when fewer than two heading candidates exist..
