Minutes

Minutes for Incident Margin readout limits.

After-action notes were being summarized as if they were complete causal analyses.

The group recorded these points.

Incident Margin states that the readout explains the detection timeline and not the attacker's intent.

Missing packet captures were listed as a limit on any claim about the initial access path.

Decision recorded: Summarize only the detection timeline and mark every unsupported step as unknown..

Recorded detail

Evaluation setup discussed: The exercise readout was checked line by line against the preserved detection logs.

Figures entered in the minutes: Four proposed causal steps had no log support and were relabeled unknown.

Caveats entered: The minutes cover one exercise and should not be generalized to production incidents without the same logs.

Questions parked: Which additional log would be required before the initial access path could be described? Risks assigned: Severity high: Filling gaps in an incident timeline with plausible steps overstates what the logs show.

Recommended action: Write unknown wherever a timeline step lacks a cited log line..
